IMPRS UFAST Call for PhD applications 2021/2022

Ab-initio nanoplasmonics and light shaping

A. Rubio-5

Title of PhD Project	Ab-initio nanoplasmonics and light shaping
Type	Theory
Supervisor(s)	Dr. Franco Bonafe and Dr. Heiko Appel Prof. Angel Rubio
Affiliation(s):	Max Planck Institute for the Structure and Dynamics of Matter
Number of positions:	1
Abstract:	<p>In this project, we are bringing together the research fields of ab-initio atomistic quantum dynamics and computational electrodynamics for a novel description of the nano-confinement of electromagnetic fields.</p> <p>This opens a vast set of novel applications in materials science, nano-plasmonics and spectroscopies. So far, exciting research has been done in these areas separately. The combination of these two dynamical methods in a fully-coupled way, will enable us to not only understand the role of the atomistic details of materials in the shaping of nano-confined light, but also to harness such spatiotemporally shaped fields to induce new properties in materials. Neither of the computational techniques developed so far have been able to tackle the full nature of some challenging open problems. Examples of such challenges are: computational design and optimization of photoelectron emission, and the impact of the field's shape and time-profile on electron tunneling or near-field enhanced spectroscopies, such as tip-enhanced Raman spectroscopy.</p> <p>The core method that will allow this is the new forward-backward coupled, self-consistent Maxwell-TDDFT time-propagation scheme that has been recently implemented in the package Octopus [1,2]. The resulting predictions will be tested experimentally by our network of collaborators, giving rise to high-impact novel developments in several fields within nano-optics, high-resolution spectromicroscopies and near-field sensing.</p> <p>[1] https://octopus-code.org/wiki/Main_Page [2] R.
